Education

- 2016–∞ **PhD**, *University of Florida*, Cryptography, advised by Tom Shrimpton.
- 2013–15 **MS**, *University of California (Davis)*, CS, advised by Nina Amenta.
- 2008–13 **BAS**, *University of California (Davis)*, CS and German.
- 2010–11 *Freie Universität (Berlin)*, study abroad.

Papers

- CCS 2019 **Probabilistic data structures in adversarial environments**, D. Clayton, C. Patton, and T. Shrimpton.
- Crypto 2019 **Security in the presence of key reuse: Context-separable interfaces and their applications**, C. Patton, and T. Shrimpton, ia.cr/2019/519.
- AsiaCCS 2019 **A hybrid approach to secure function evaluation using SGX**, J. Choi, D. Tian, G. Hernandez, C. Patton, B. Mood, T. Shrimpton, K. Butler, and P. Traynor.
- NDSS 2019 **Digital healthcare-associated infection: A case study on the security of a major multi-campus hospital system**, L. Vargas, L. Blue, V. Frost, C. Patton, N. Scaife, K. Butler, and P. Traynor.
- CCS 2018 **Partially specified channels: The TLS 1.3 record layer without elision**, C. Patton, and T. Shrimpton, ia.cr/2018/634.
- Crypto 2017 **Hedging public-key encryption in the real world**, A. Boldyreva, C. Patton, and T. Shrimpton, ia.cr/2017/510.

Experience

- Summer 2018 **Delegated credentials for TLS**, *Internship at Cloudflare–SF*.
Delegated credentials for TLS is an extension that allows an operator to delegate short-lived credentials for terminating connections on its behalf. I implemented the extension for boringSSL, added support to Cloudflare’s edge servers, and helped develop the standard. Once browsers adopt it, this extension will make TLS more secure in practice. One problem with short-lived credentials is that client-clock skew limits their effective lifetime. To help address this, I also deployed the Roughtime protocol, which is now live.
- Summer 2016 **Malware detection**, *Internship at Google–Montréal*.
I worked on the Chrome Protector team, which is tasked with defending users from malware and other unwanted software. My project took a data-driven approach to detecting malware campaigns in the wild, and involved studying how malicious code gets injected into the browser. I also explored using Riposte for anonymous reporting in Chrome.
- Summer 2015 **Trustworthy computing**, *Internship at Google–Kirkland*.
CloudProxy is an open source project that binds the identity of a service (that is, its public key) to the code that executes it, as well as the environment in which it executes. My project for the Cloud Security team involved bringing this platform to bear on production servers at Google. I also worked on the open source codebase and implemented a mixnet for the platform.

2013–15 **QRAAT**, *John Muir Institute of the Environment (JMIE)*.

The Quail Ridge Automated Animal Tracking (QRAAT) system is designed to provide ecologists with high resolution, real-time animal tracking data. It is comprised of a network of radio receivers deployed across the Quail Ridge Nature Reserve in Napa Valley, California, and uses radio telemetry to track species ranging in size from field mice to foxes. My master's project involved developing statistical methods for improving the system's performance.

2012–13 **Qurinet**, *JMIE*.

Qurinet is an experimental, wireless, solar-powered mesh network that provides the network infrastructure for the QRAAT project and other monitoring equipment. I was responsible for network administration and site reliability, and I assisted in experiments for the networking lab at UC Davis.

Service

Paper review **Conference:** Asiacrypt 2016, Usenix 2017, and Crypto 2019.

Journal: TDSC Vol. 15, No. 5.

Awards

Grants NSF: SaTC: CORE: Small: API-centric Cryptography (CNS-1816375).

Scholarships Benjamin A. Gilman International Scholarship Program, 2010.
